Specialists in Sound Masking

Are their privacy issues or distractions in the office, boardroom, open plan space or adjoining corridors? Are areas too noisy or too quiet?

If you come across any of these issues then you should consider the introduction of Sound Masking.

Sound Masking provides increased privacy and greater productivity combined with comfort in the work place.

Sound Masking can improve the acoustic environment in just about every situation.

Sound Masking emitters are mounted into the ceiling, operated by the controller that generates the sound, with multiple zoning and volume capability.

The sound is transmitted as four uncorrelated channels, eliminating any risk of phasing effects often associated with some other systems.

This sound creates very pleasant and comfortable masking sounds.

Sound Masking systems are a very cost effective solution to improving speech privacy.

A correctly designed and a correctly installed system can make a vast improvement to the working environment.

Sound Masking is the introduction of an un-obtrusive background sound, similar to airflow, the technology is designed to match the frequency spectrum of human speech, by reducing the intelligibility of human speech such that conversations are masked.
